Day 3 · Pitch the season

Sobey HS Co-Op · Business Analytics & AI · Friday, October 30 · teams of 2 or 3 · **slides emailed to Gavin by 12:10** · 3-minute presentations, in season order

1 · YOUR LANE IS A STORE

- **halloween costume** · party store
- **pumpkin spice** · café
- **valentines day** · florist / card shop
- **snow tires** · garage
- **candy** · convenience store
- **christmas gifts** · gift shop
- **sunscreen** · pharmacy
- **back to school** · stationery store

Our lane: _____

2 · FIND YOUR SEASON

Seasonal Workbook, section 6: set LANE, run every cell. Find:

- **Peak week**: when is the lane busiest?
- **Stock-up week**: the first week at or above 50% of the peak (shelves must be full)
- **Season length**: how many weeks stay above the bar?
- **Same every year?** Compare the years in your season table (6d).

Chart rule: 2 or 3 charts from section 6, and at least one is a **box plot, heatmap, histogram or scatter**. Every chart: a title that states the finding, labelled axes, a source line, and **one honest limit** said out loud.

3 · MAKE THE DECISION

- **Stock date**: shelves full by the stock-up week
- **Ad start**: a week or two before that
- **Markdown date**: after the last busy week
- **How to check it**: next year's real sales, not searches

4 · YOUR SLIDES: TITLE + 3

0. **Title:** your lane, your store, your team's names
1. **What we did:** one cell explained line by line (try 5a or 6a)
2. **What the data proves:** 2 or 3 charts and one honest limit
3. **The decision + how we used AI:** stock date, ad start, markdown date, how you'd check it; what the AI did and how you checked it

5 · HONEST LIMITS (PICK AT LEAST ONE)

- Google Trends is **relative search interest** (0 to 100), not sales and not counts
- Canada-wide, not Nova Scotia; one search term per lane
- NRF spending is **US shoppers in US dollars**, a survey forecast each September
- The 50% threshold is a choice; 2021 and 2026 are partial years

6 · SEND ONE OF THESE TO GAVIN BY 12:10

- a PowerPoint (your 4 slides; charts from the Files panel), or
- a Google Slides link (shared so Gavin can open it), or
- an **AI-built HTML dashboard**, attached as an .html file. Encouraged!

Want an AI-built dashboard? Dashboard Skill.md is on the download page. Paste your season table or month table from step 6f, not the raw data, then check every number against your notebook.

AI rules (Day 2): no personal information · run it yourself · the AI can be wrong.

Presentation order: back to school → halloween costume → candy → pumpkin spice → christmas gifts → valentines day → snow tires → sunscreen.

RUBRIC · 16 POINTS (ONE ROW PER SLIDE, PLUS DELIVERY)

Criterion	4	3	2	1	Score
What we did (slide 1): explain one cell	Walks through one cell line by line and says why each line is needed	Explains what it does, with small gaps	Reads the code aloud without explaining it	Can't explain it	
What the data proves (slide 2): charts	A clear claim, 2 or 3 readable charts (at least one box plot, heatmap, histogram or scatter) from real output, and one honest limit	Claim + charts, but bar or line only, or no limit	Claim with a weak or unlabelled chart	Opinion only, no chart	
The seasonal decision (slide 3)	Stock date, ad start and markdown date that follow from the charts, plus how to check it with real sales	Dates given, weakly tied to the charts, or no way to check	Vague ("stock up in the fall")	Missing	
Delivery, time and use of AI	Everyone speaks, within 3 min; says what the AI did and how they checked it	Everyone speaks; slightly over time or thin on checking	One speaker dominates, or no AI checking	Unprepared or well over time	
				Total	**/16**

Data: Google Trends (Canada, web search, weekly, Oct 2021 to Oct 2026, read Oct 29, 2026); NRF / Prosper Insights & Analytics annual Halloween survey, 2005 to 2026 (US consumers, US dollars). Partial years stay flagged; gaps stay gaps.
